Information for pre-design templates

Standard 5-7 pages website

Site Map

1. Home page/About Us
2. Our Services
3. Our team
4. Photo Gallery
5. Contact Us

The above site map is the standard headings.

However, the heading can be subsituted/replace for other headings.

** reference site:

Definition of 1 page:

1 Page Design Elements

- **Header and Footer**: These are often included in the layout of a page, containing navigation, logos, and contact information. Despite their commonality across multiple pages, they are still part of the 1-page design.
- **Body Content**: This includes the main information, images, text, forms, videos, etc., displayed in the central part of the page.

Page Length

- **Scrollable Area**: A page may extend beyond the visible screen, requiring users to scroll down. Even if the page scrolls extensively, it's still considered one page, as long as it is part of the same URL.
- **Single-Page Websites**: These are often longer in length and have sections like "Home," "About Us," "Services," etc., all in one page. It's still measured as 1 page despite multiple sections.

URL Structure

- **Unique URL**: If a page has its own unique URL (e.g., "example.com/about"), it counts as one page. If multiple pieces of content load dynamically on one URL, that's also still considered a single page.

Functional Components

- **Interactive Features**: Things like forms, sliders, carousels, or embedded videos do not necessarily change the page count. These features might add complexity to the design but don't create new pages.

Screen Resolution

- **Pixels** are the smallest units of a digital display, and screen resolution is the total number of pixels in each dimension (width x height).

- When you hear "768 pixels," it typically refers to the height of the display, often mentioned in the context of resolutions like **1024 x 768 pixels**, where:
  - **1024 pixels** = The width (horizontal resolution)
  - **768 pixels** = The height (vertical resolution)

Usage in Web Design

- In web design, 768 pixels often refers to **responsive breakpoints** for tablets or small-screen laptops. Many tablets, like the iPad in landscape mode, have a resolution around **768 pixels in height**.

- It's a standard size that designers use to ensure a website looks good on medium-sized screens.

Aspect Ratios

- A resolution of **1024 x 768** (width by height) is common for a **4:3 aspect ratio**, which was widely used in older monitors, tablets, and some laptops.

Responsive Design

- In responsive web design, developers often design for specific breakpoints like 768 pixels, ensuring that the layout and elements adjust properly when viewed on devices with those screen sizes.

Web Development Responsiveness Guidelines

1. **Ensure Cross-Device Compatibility**: All web pages must automatically adjust and display correctly on **PCs, mobile devices, and tablets**.

2. **Fluid Grid Layouts**: Use **fluid grids** and percentage-based widths to create flexible layouts that scale with different screen sizes.

3. **Flexible Images & Media**: Implement **responsive images** and media queries to ensure that images, videos, and other media adapt to the screen size without distortion or overflow.

4. **Breakpoints for Key Devices**:
   - **Desktop**: Typically designed for screens wider than **1024px**.
   - **Tablet**: Optimized for screens around **768px** wide.
   - **Mobile**: Optimized for screens typically under **600px** wide. Use media queries to ensure the layout adjusts accordingly for these breakpoints.

5. **Touch-Friendly Elements**: For mobile and tablet designs, ensure that buttons, menus, and other interactive elements are large enough for touch input and easily clickable without zooming.

6. **Navigation Adjustments**: Use **responsive menus** (e.g., hamburger menus) for mobile and tablet screens to save space and improve usability.

7. **Font & Text Scaling**: Ensure text sizes are scalable and readable across devices. Use **relative units** like em or rem to adjust font size dynamically.

8. **Viewport Meta Tag**: Include the <meta> viewport tag in the HTML header to instruct the browser to adjust the layout based on device screen width:

9. **Performance Optimization**: Minimize loading times on mobile devices by using **lazy loading**, compressing images, and optimizing JavaScript and CSS.

10. **Testing Across Devices**: Regularly test the website on various physical devices or use online tools/emulators to verify the responsiveness and functionality across PCs, mobiles, and tablets.

***Important**: Following these guidelines ensures that every web development project is responsive and delivers a seamless user experience on all device types.

*** **Important**: To double check the web development on 3 devices:
1. PCs,
2. Mobile devices, and
3. Tablets

Both IOS & Android

***Important:** You must submit at least 3 Categories of pre-designs templates for sale. You can select from the business categories accordingly.

*** The price you need to indicate between: USD$8 - USD$18.

Business Categories:

1	Automotive	12	Event & Wedding Planning	23	Logistics & Transportation
2	Art & Photography	13	E-commerce	24	Marketing & Advertising
3	Agriculture & Farming	14	Education & Training	25	Medical doctors
